**ANEJO Nº8****DRENAJE****1. INTRODUCCIÓN**

El objeto del presente anejo es detallar el sistema de drenaje de las instalaciones del Centro Tecnológico Nokian Tyres (CTNT). A lo largo del documento se presenta el estudio de los diferentes elementos de evacuación de agua de escorrentía superficial que afectan al trazado, tanto por la intersección con cauces naturales como por la nueva escorrentía generada en los diferentes circuitos y edificios del CTNT.

La información obtenida en el Anejo 4 de Climatología e Hidrología es utilizada para abordar los cálculos más detallados de los diferentes elementos presentes en este anejo.

Por la configuración de los distintos elementos que forman el Centro Tecnológico (explanadas para las distintas instalaciones y viales), la mayor parte serán elementos de drenaje longitudinal, formado por una red de cunetas interiores que evacúen el agua de lluvia de las plataformas, y una red de cunetas exteriores a las plataformas. Finalmente, se propone la construcción de un canal de descarga para poder drenar la zona deprimida dentro de la parcela del circuito. Con ello se pretende canalizar el agua de lluvia para evitar que se almacene e infiltre. Como elementos de drenaje transversal existen varios tubos pasa cunetas para solucionar los cruces de las cunetas con los viales.

La metodología utilizada para el estudio de drenaje se basa fundamentalmente en la Instrucción 5.2.-I.C.: "Drenaje Superficial". También se han tenido en cuenta las 5.1-IC "Drenaje" y "Obras pequeñas de paso: Dimensionamiento hidráulico" de la Dirección general de Carreteras.

En el anejo 4 de Climatología e Hidrología se caracterizan las principales cuencas que vierten sobre el emplazamiento del CTNT, y es en este anejo donde se estudia más detalladamente la interacción entre las cuencas drenantes y el conjunto de circuitos y edificaciones que componen el CTNT.

El presente Anejo aborda en primer lugar la definición y dimensionamiento hidráulico de las obras de drenaje transversal necesarias para el adecuado funcionamiento de la red hidrológica superficial.

En segundo lugar se estudia y dimensiona la red de drenaje longitudinal, aquella que permite evacuar la escorrentía superficial de la plataforma y de los márgenes que vierten hacia ella, y por otro la red de drenaje subterráneo, bajo la plataforma, que se considera necesaria para evacuar el agua al terreno y evitar daños a la misma.

**2. ESTUDIO DE CUENCAS INTERNAS AL CENTRO TECNOLÓGICO NOKIAN TYRES**

En el Anejo 4 "Climatología e Hidrología" se exponen, en primer lugar, unas cuencas de estudio obtenidas mediante ráster. Las cuencas obtenidas mediante los procedimientos indicados anteriormente han servido para delimitar las áreas de posible afección (AE1-AE6) de la construcción del circuito a la escorrentía superficial presente en la zona. Partiendo de esta información, se realiza un estudio pormenorizado de las mismas en cuyo resultado se obtienen unas cuencas internas, definidas también en el mismo anejo, que delimitan con mayor exactitud las áreas de depresión o acumulación de escorrentía del terreno natural afectado por la construcción del óvalo exterior del CNTN, donde se sitúan las obras de drenaje transversal propuestas (ODT). La situación de estas cuencas se muestra en la Figura 1. Cuencas interiores al CTNT.

Las cuencas internas al CTNT servirán para calcular el caudal máximo de diseño para las obras de drenaje transversal que afectan tanto al óvalo exterior como a los distintos circuitos interiores. La caracterización física e hidrológica de las cuencas queda definida en el Anejo 4.

A la hora de determinar el diseño de los elementos de desagüe es fundamental estudiar el grado de afección de las mismas sobre el emplazamiento considerado.

En primer lugar se ha realizado la definición y el dimensionamiento hidráulico de las obras de drenaje transversal necesarias para el adecuado funcionamiento de la red hidrológica superficial. En esta fase se engloban tanto las exteriores al circuito como las del interior al mismo. Para la realización de este cálculo se han tenido en cuenta los diferentes terrenos que aportan escorrentía a nuestra cuenca con diferentes coeficientes de escorrentía. En nuestro caso, se utilizan los correspondientes coeficientes de escorrentía calculados para zonas donde hay firme y para el terreno presente dentro de cada cuenca. Este cálculo se realiza según la metodología descrita en el capítulo 11 del Anejo de Climatología e Hidrología que se corresponde a la descrita en la norma 5.2 – IC Drenaje Superficial de la Instrucción de carreteras.

Con ello se obtienen el caudal que se genera por escorrentía superficial en el terreno y el que se genera en la carretera.

En segundo lugar se ha estudiado y dimensionado la red de drenaje longitudinal, consistente en un conjunto de cunetas revestidas de hormigón de diferentes tipologías, localizadas a ambos lados de la carretera que rodean el perímetro del CTNT, permiten evacuar tanto la escorrentía superficial como el agua de la carretera y el que se dirija a los desmontes o terraplenes.

Además, se define unos encauzamientos que conducen el agua que se acumula en la zona deprimida, cuya finalidad es la derivación del agua acumulada en ese punto hacia una de las obras de drenaje transversal.

A continuación se muestra una imagen de las cuencas internas al CTNT, cuyos caudales se han utilizado para el dimensionamiento de los distintos elementos de drenaje considerados.

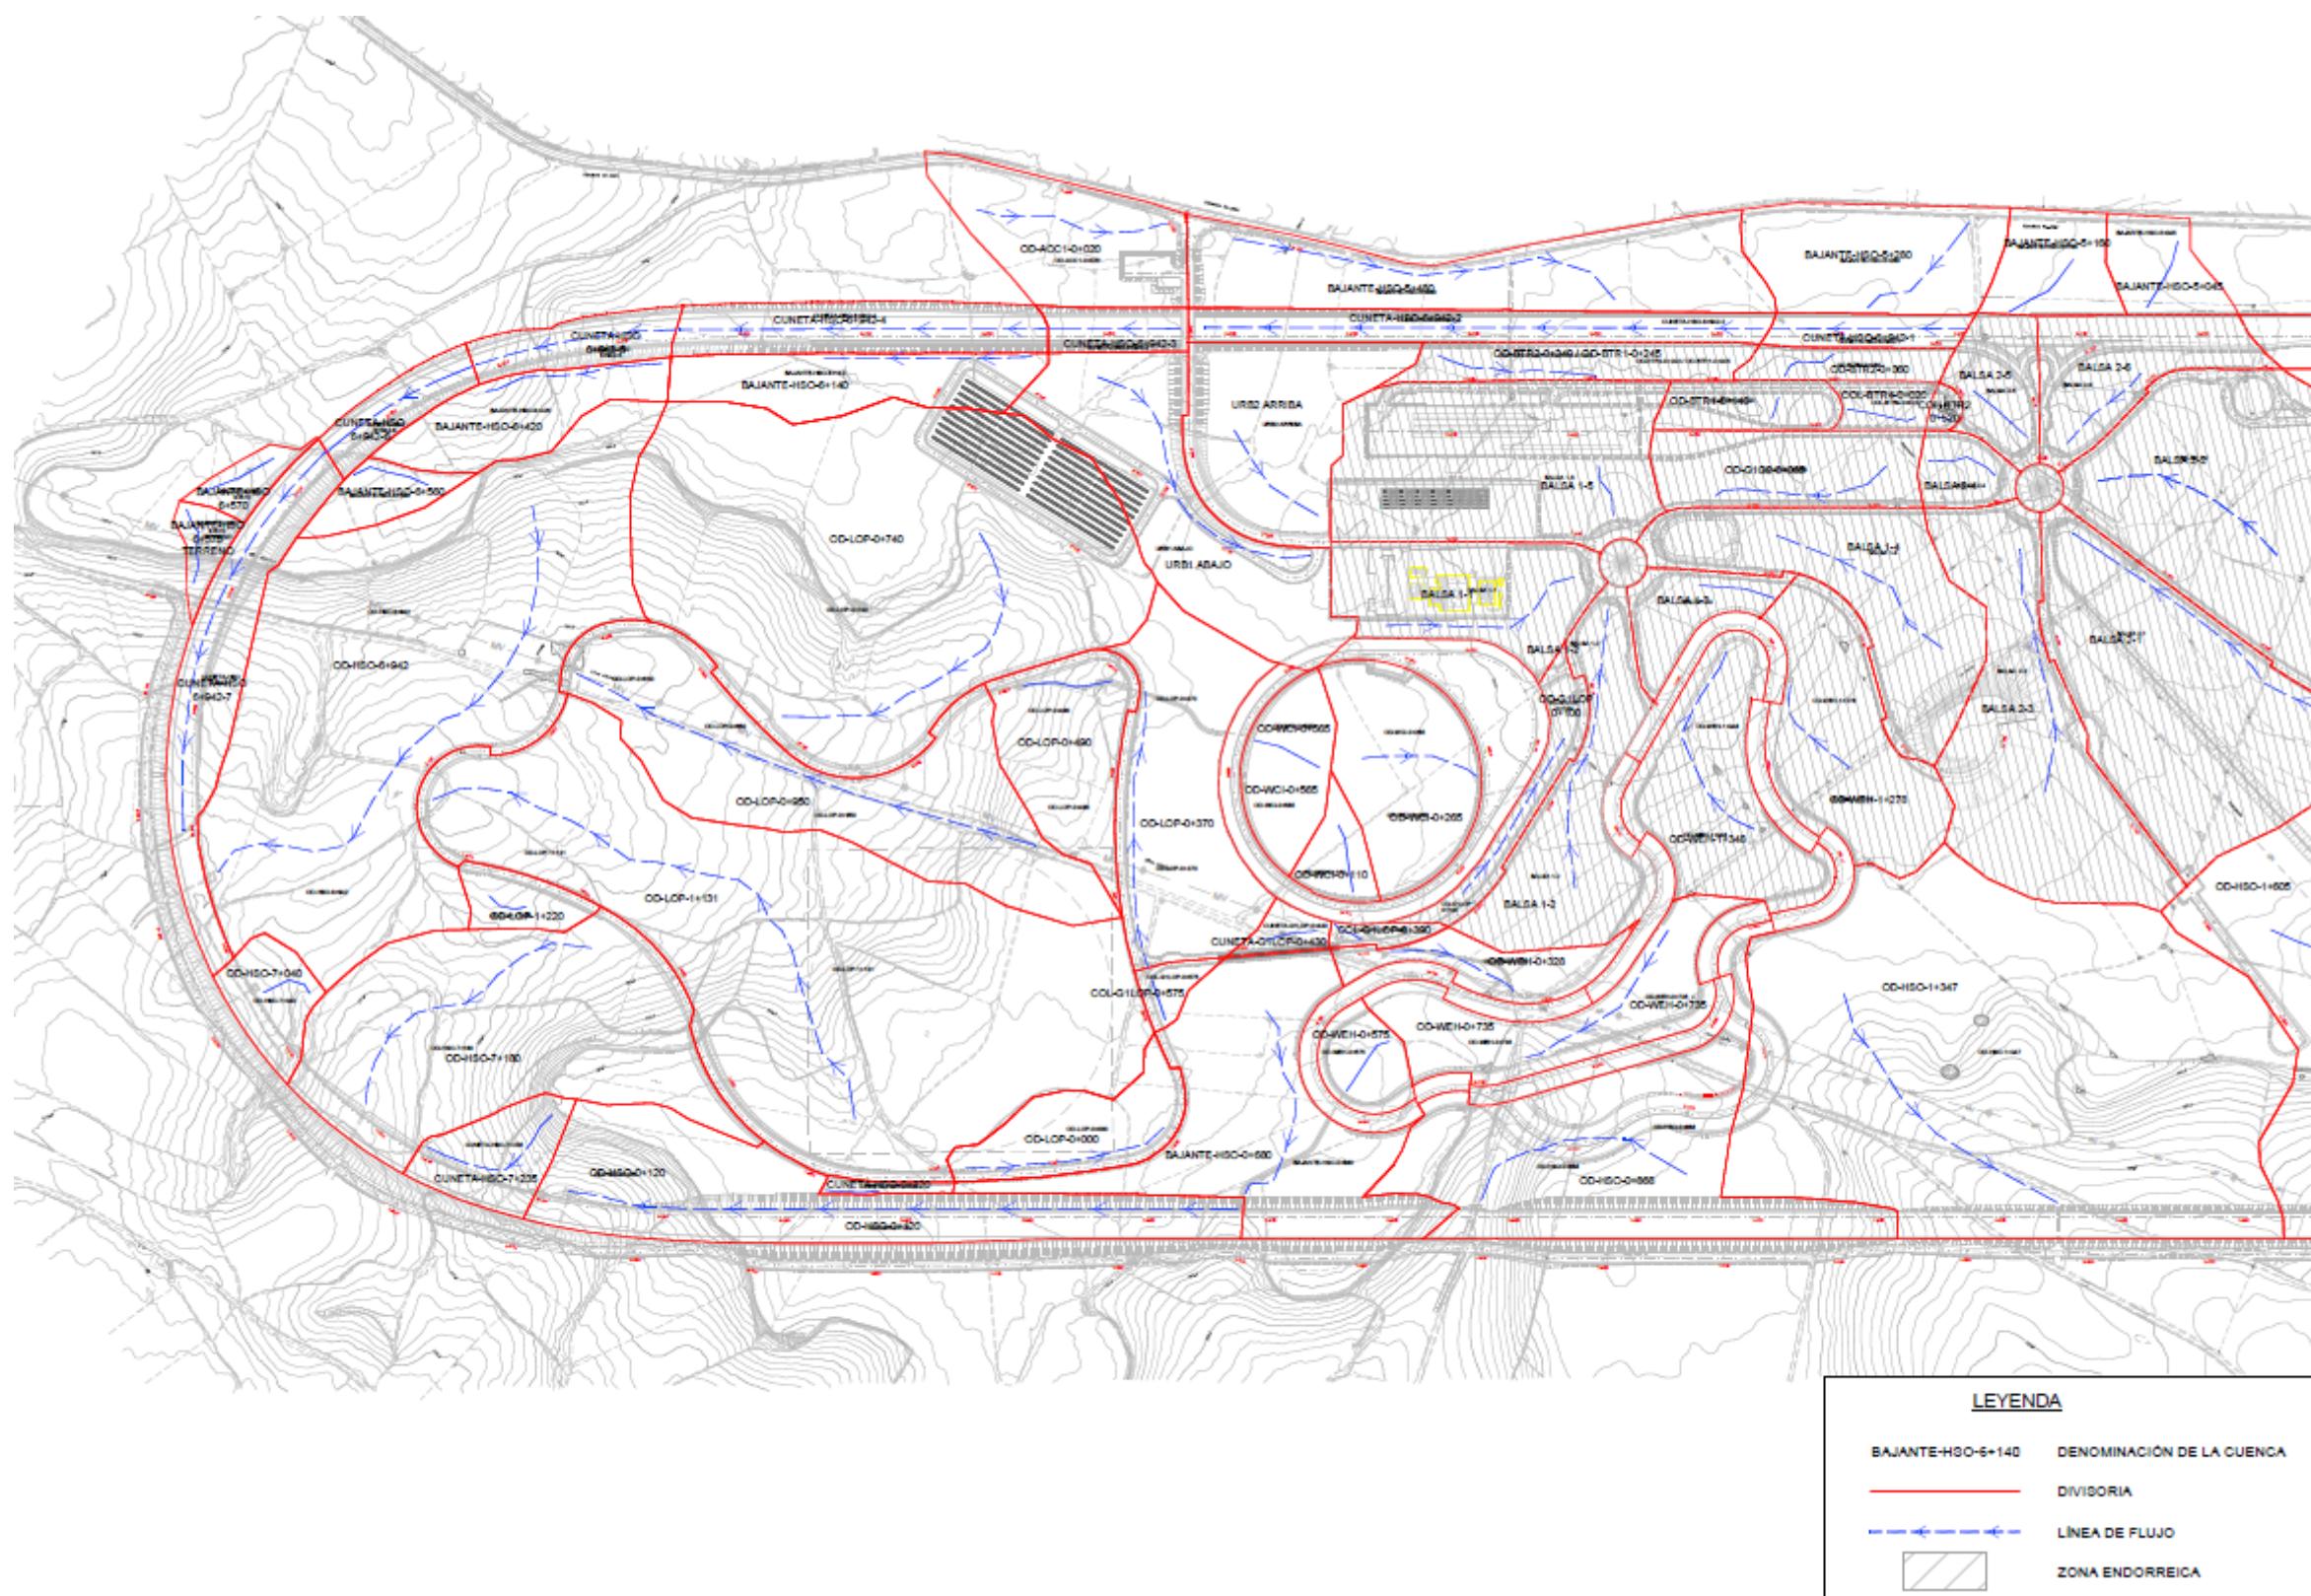

Figura 1. Cuencas internas parte 1

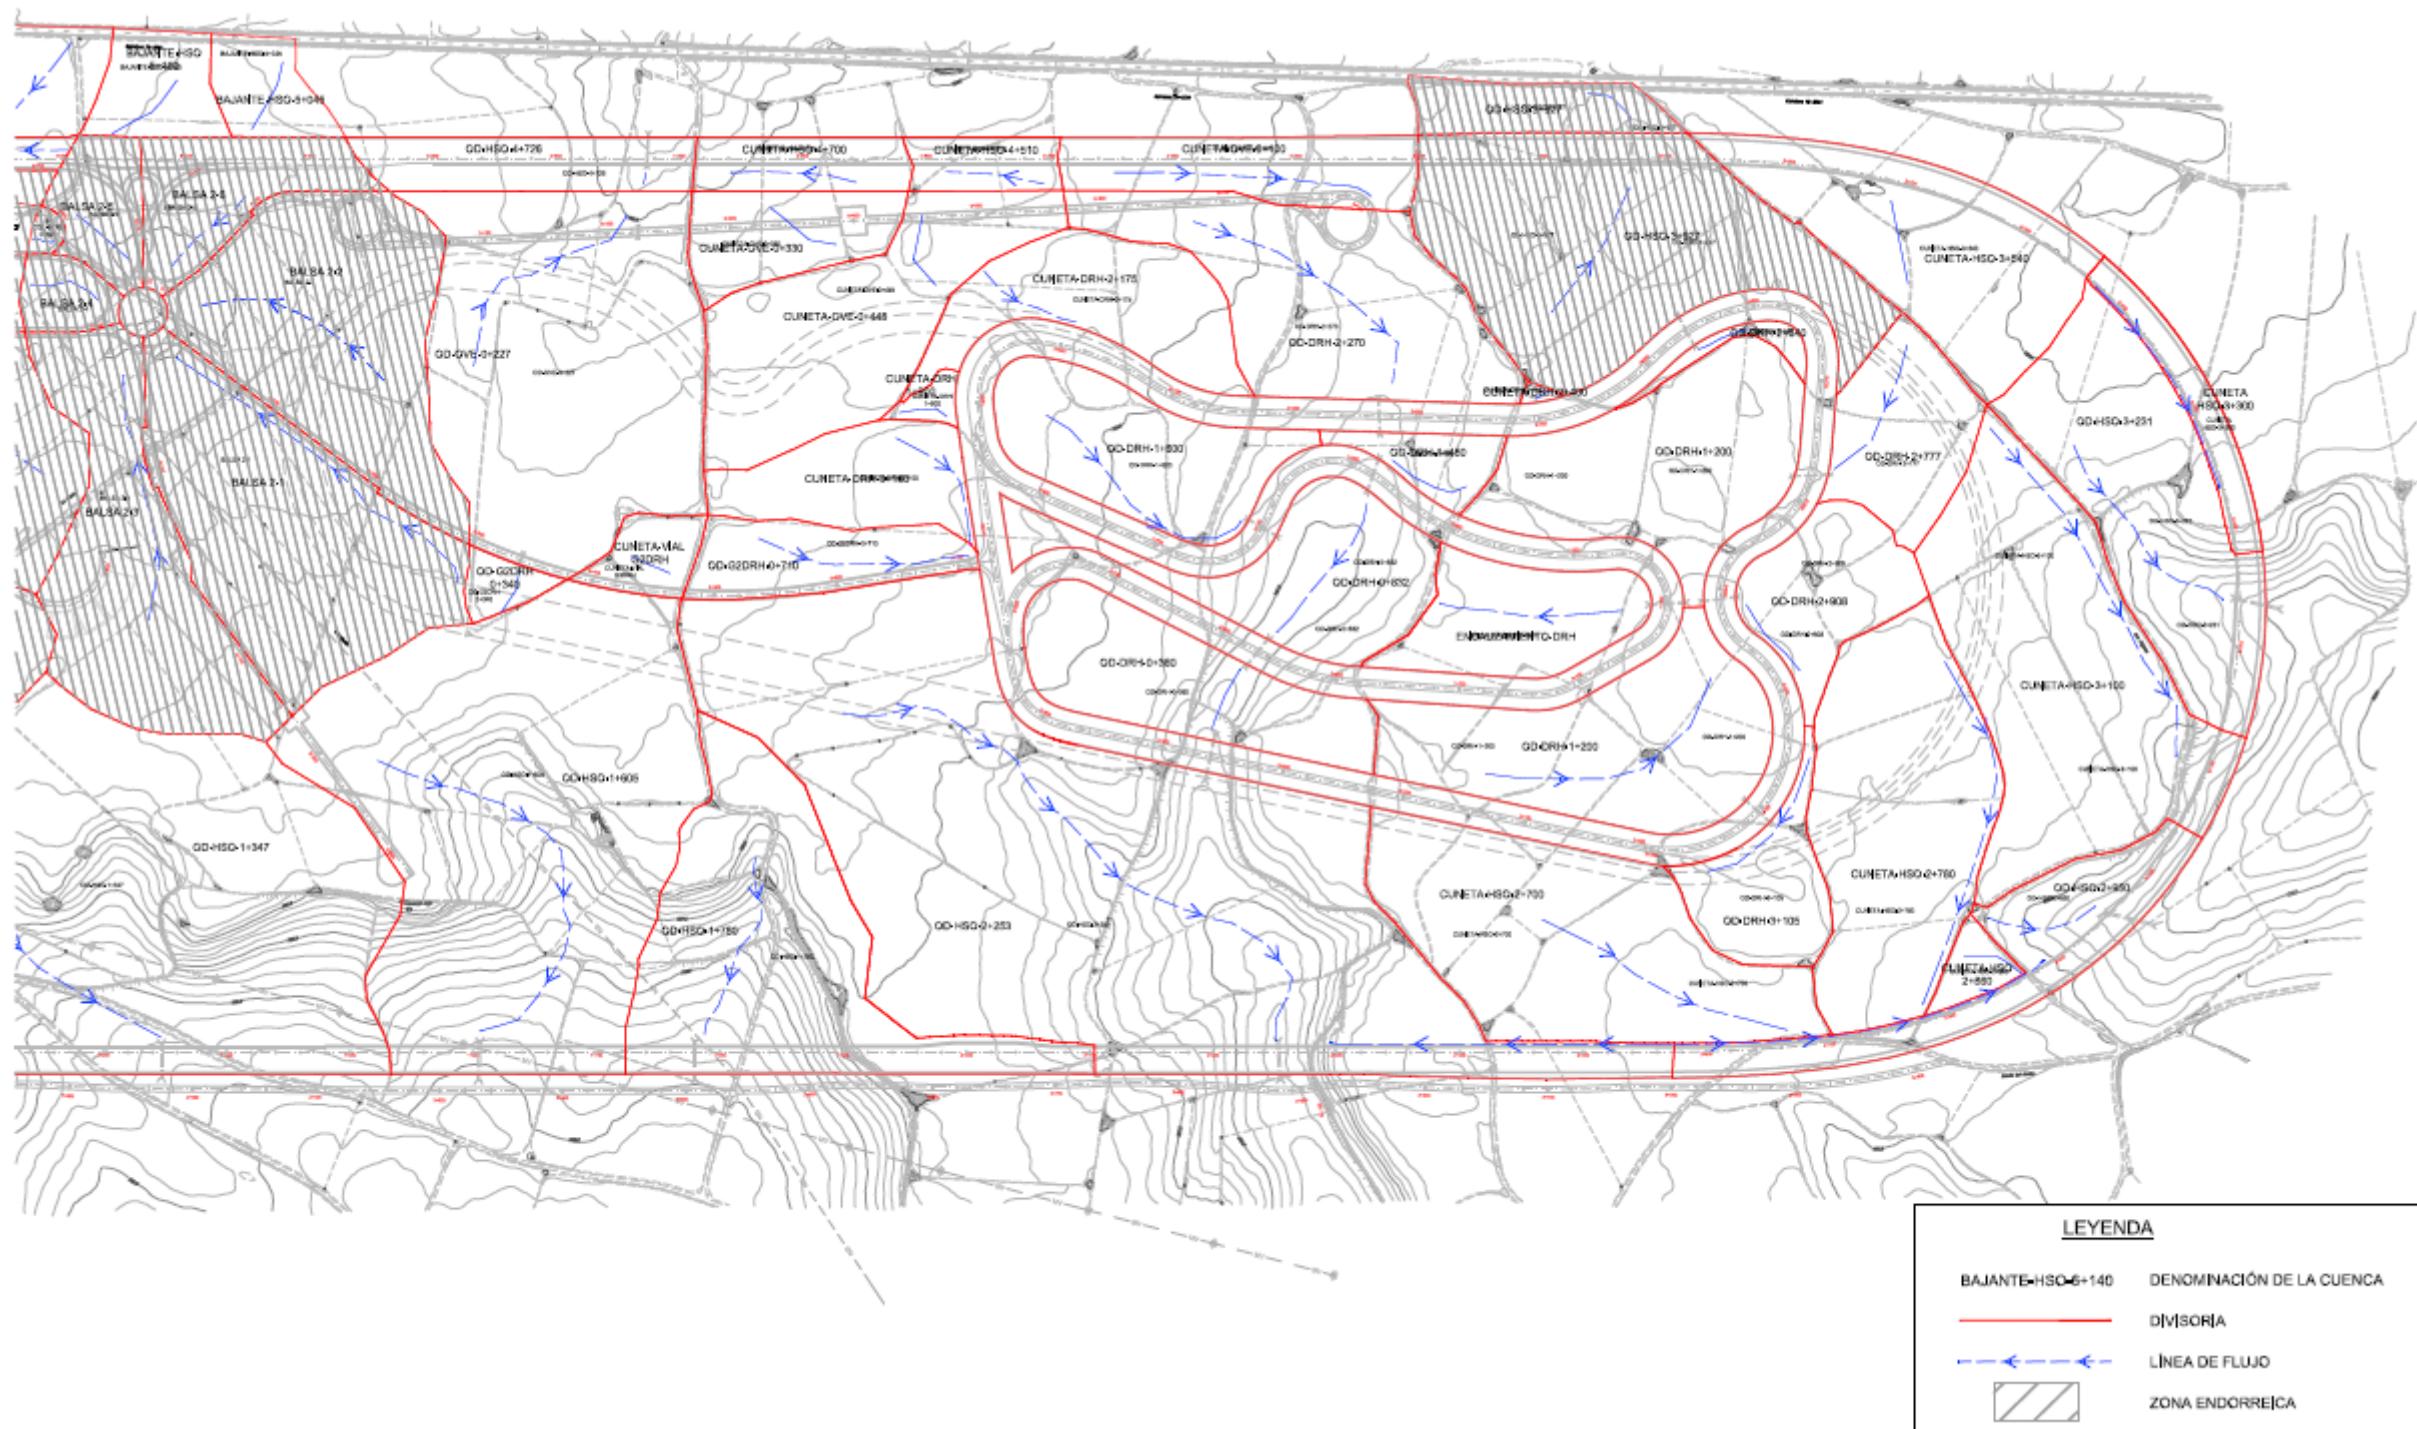

Figura 2. Cuencas internas parte 2

### 3. OBTENCIÓN DE LOS CAUDALES PARA DIFERENTES ELEMENTOS DE DRENAJE DEL ÁREA DE PROYECTO

En relación a la obtención de caudales máximos para el diseño de los diferentes elementos de drenaje, no se han utilizado los datos sobre caudales máximos proporcionados por la administración hidráulica debido a que en la zona de proyecto no se encuentran disponibles. Al tratarse de un proyecto de características singulares se realiza el cálculo de los mismos.

La metodología empleada para estimación de los caudales de avenida de cada una de las cuencas vertientes al CTNT asociados a los distintos períodos de retorno considerados, se especifica en la normativa 5.2-IC "Drenaje Superficial", y se desarrolla en el capítulo 2 del Anejo 4 "Climatología e Hidrología". Estos caudales son imprescindibles para el dimensionamiento de los elementos de drenaje.

En el anexo de Climatología e hidrología se muestran los cálculos de los caudales de cada cuenca para diferentes períodos de retorno. Es en este anexo en el que para el diseño de los elementos de drenaje se utiliza el caudal correspondiente al periodo de retorno establecido según la tipología del elemento. Tal y como se indica en los Términos de Referencia del presente proyecto, las obras de drenaje transversal se han diseñado considerando un periodo de retorno de 100 años, las cunetas y bajantes se han diseñado para un periodo de retorno de 25 años y, los demás elementos de drenaje han sido comprobados para los caudales correspondientes en cada caso.

Se ha tenido en cuenta lo expuesto a continuación:

- $K_A$  (adimensional) Factor reductor de la precipitación por área de la cuenca. Al ser  $A < 1 \text{ km}^2$ , se toma  $K_A = 1$ .
- En el caso de las ODT, de acuerdo con el Caudal para  $Tr=100$  años se establecen para el cálculo los siguientes parámetros  $Pd = 88,80 \text{ mm}$  y  $Po = 41,54 \text{ mm}$ , y en el caso de las cunetas los valores de  $Pd$  y  $Po$  como  $69,28 \text{ mm}$  y  $34,62 \text{ mm}$  respectivamente.
- Los cálculos relativos al máximo caudal anual, la intensidad de precipitación, y la escorrentía superficial, siguen las directrices de cálculo definidas en el anexo de climatología e hidrología, así como los cálculos necesarios para conseguir tales valores.

A continuación se definen los trabajos necesarios para realizar el diseño de los diferentes elementos de drenaje para el proyecto CTNT.

Así mismo cabe indicar, tal y como se refleja en los planos de DRENAJE del presente documento, que no se ha interceptado el gaseoducto existente que cruza el ámbito del proyecto.

### 4. DIMENSIONAMIENTO DEL DRENAJE LONGITUDINAL Y TRANSVERSAL

#### 4.1. DRENAJE TRANSVERSAL

##### 4.1.1. Planteamiento General

El drenaje transversal de los circuitos tiene la función de proporcionar un medio para que el agua superficial que escurre por cauces naturales o artificiales, en forma permanente o eventual, pueda atravesar bajo las plataformas de los circuitos sin causar daños a éstos. Las obras de drenaje transversal deberán perturbar lo menos posible la circulación del agua por su curso natural.

El proyecto del drenaje transversal se ha abordado conforme a la sistemática habitual para el diseño de ODTs. En primer lugar se han estudiado las cuencas principales para obtener los caudales de proyecto en las secciones donde se ubican las obras de drenaje transversal de acuerdo con el método Racional descrito en norma 5.2-IC de Drenaje Superficial de la Instrucción de Carreteras. Posteriormente, en función de los caudales de punta obtenidos se ha determinado un diámetro para cada una de las obras y se ha verificado su capacidad hidráulica para un caudal de 100 años de periodo de retorno conforme a los Términos de Referencia.

La comprobación hidráulica de las obras de drenaje se ha realizado mediante el programa HY-8 Programa para el cálculo y diseño de obras de drenaje transversal realizado por la FHWA de EE.UU. Este programa nos permite obtener los datos más relevantes para la comprobación hidráulica de las ODTs según el manual de "Obras pequeñas de paso: Dimensionamiento hidráulico" publicado por la Dirección General de Carreteras. Este manual se refiere al método promulgado por el Bureau of Public Roads (actual FHWA, Federal Highway Administration) que es el mismo que el método usado por el software. Al introducir los datos de partida referentes a las cotas de entrada y salida de la ODT, longitud de la ODT, cota de la rasante de la carretera y el caudal vertiente, se obtienen los valores de la altura de la lámina de agua en diferentes secciones de la ODT, pudiendo valorarse la capacidad, la tipología del control y las elevaciones del agua tanto a la entrada como a la salida de la misma de cara a la comprobación final.

En el Apéndice 1: "RESULTADO CÁLCULOS ODT HY-8" pueden encontrarse los cálculos realizados para el dimensionamiento de las ODTs del óvalo, mientras que el apéndice 2: "RESULTADO CÁLCULOS ODTI HY-8" contiene los cálculos realizados para las obras de drenaje de los circuitos y caminos interiores al óvalo.

##### 4.1.2. Elementos de drenaje transversal

Para el óvalo exterior del CTNT se proponen 13 obras de drenaje transversal. Para el dimensionamiento de las mismas se han obtenido los caudales de diseño teniendo en cuenta la afección del los circuitos interiores en términos de drenaje. En el interior del centro tecnológico las obras propuestas son un total de 35.

En cuanto a dimensiones mínimas, se ha tenido en cuenta el capítulo 4 de la Instrucción 5.2.-IC, valorando las posibles variaciones permitidas por los Términos de Referencia del Proyecto. Bien es cierto que la norma recomienda unas dimensiones mínimas de las ODTs en función de su longitud; estas recomendaciones han sido tenidas en cuenta pero se ha valorado la instalación de diámetros inferiores a los propuestos para abaratar el coste de las mismas y teniendo en cuenta que las obras de drenaje transversal cumplen en todo momento con el condicionante recogido en los TdR de que la altura de las embocaduras de la ODT sea al menos 1,2 veces la altura libre del conducto ( $HE < 1,2 \text{ H}$ ).

El encaje de las obras se ha realizado sobre el perfil transversal del cauce ajustando la pendiente de la obra con la de aquél, respetando en lo posible la pendiente existente. El resguardo mínimo exigido por la norma 5.2. – I.C. en su apartado 1.2. B entre el máximo nivel de la lámina de agua y la superficie de la plataforma para elementos de drenaje superficial de la plataforma es de 0,5 (cero coma cinco) metros. Este resguardo se ha tenido en cuenta a la hora de diseñar las ODT.

Cada conducto tiene una curva característica, que relaciona el caudal que desagua a través de él con la cota que alcanza la lámina de agua inmediatamente aguas arriba. Para definir esa curva característica se diferencian dos tipos de control -o secciones determinantes- que pueden producirse en el régimen hidráulico del desagüe: control de entrada o control de salida. Según lo establecido en los TdR del proyecto, la orientación de las ODTs se ajusta a un control en la entrada, cumpliéndose  $HW < 1,2 D$ , de forma que el conducto fluye con superficie de agua libre en la sección de control y la entrada no es sumergida, a fin de evitar daños en las zonas adyacentes.

#### 4.1.3. Características de las ODTs

El material propuesto para su construcción es tubo de hormigón armado; para su localización se han tenido en cuenta las características geotécnicas de los terrenos donde se ubican las obras, los costes de las posibles tipologías y los sistemas de ejecución. Con respecto a las embocaduras y desembocaduras se han contemplado aletas y solera de hormigón armado de una pieza.

La escorrentía producida en la zona deprimida BALSA1, representada en el plano de cuencas (figuras 1 y 2), no será desaguada por ninguna ODT sino que se recoge en la balsa propuesta cercana a la glorieta G1.

#### 4.1.3.1. ODT ÓVALO

En la siguiente tabla se relacionan las obras de drenaje transversal al óvalo, con caudal Q correspondiente a  $Tr= 100$  y sus características principales. Los resultados de la comprobación hidráulica con el programa HY-8. Se pueden consultar en el Apéndice 1: "RESULTADO CÁLCULOS ODT HIGHSPEEDOVAL HY-8".

Tabla 1. Información ODTs óvalo

#### 4.1.3.2. ODT CIRCUITOS INTERIORES

En el interior del circuito, el procedimiento de cálculo de los caudales de diseño para las ODT ha sido análogo. Se ha aproximado un área de cuenca vertiente a cada ODT, y siguiendo el método explicado con anterioridad, se han obtenido los resultados de los caudales de diseño.

Los resultados obtenidos, se han comprobado con el programa HY-8. Estos resultados se pueden consultar en el Apéndice 2: "RESULTADO CÁLCULOS ODT CIRCUITOS INTERIORES HY-8".

En las siguientes tablas se relacionan, ordenadas por circuitos, las obras de drenaje interiores al óvalo, con caudal Q correspondiente a  $T_r = 100$  y sus características principales.

Tabla 8. Información ODTs VIALES Y OTROS

## 4.2. DRENAJE LONGITUDINAL

### 4.2.1. Planteamiento General

La finalidad perseguida con el diseño de los distintos elementos que forman parte del drenaje longitudinal es la recogida de las aguas pluviales que llegan a las márgenes de la calzada del óvalo y del resto de circuitos para su posterior evacuación.

Los propósitos de la evacuación de agua llevada a cabo por el drenaje longitudinal son:

- Evitar que el agua invada total o parcialmente la plataforma o permanezca en ella.
- Evitar infiltraciones perjudiciales para el firme.
- Evitar deterioro en los taludes de desmonte o terraplén por erosión.
- Evitar infiltraciones en los terraplenes, que los podría desestabilizar.

En primer lugar, es necesario evacuar el área recogida directamente por la plataforma, lo que se realiza principalmente por escorrentía superficial, ya que los firmes de calidad son muy cerrados, e impiden la infiltración del agua de escorrentía a través de ellos. El agua es enviada a un lateral de la calzada donde es recogida por las cunetas correspondientes, y posteriormente enviada al exterior de la explanación del vial.

Paralelamente a la carretera se dispondrán las cunetas anteriormente mencionadas para recoger las aguas pluviales de escorrentía que pudieran circular por la calzada o por aquellas superficies que vierten hacia la infraestructura de la misma. Así, se dispondrán cunetas en los bordes de calzada de los tramos dispuestos en desmonte y se dispondrán cunetas de pie de terraplén en las zonas donde exista.

Además en estas zonas de terraplén, se incluyen bordillos dispuestos de manera longitudinal con zonas de bajantes cada 30 metros para evitar que el agua proveniente de la calzada pueda erosionar los taludes hasta su recogida en los elementos de drenaje correspondiente, en este caso las cunetas de pie de terraplén.

Todas estas cunetas se dispondrán de forma continua, desaguando a las obras de drenaje existentes. Se aconseja un adecuado mantenimiento de las mismas, ya que en caso contrario se podría llegar a provocar obstrucciones en la cuneta. Las cunetas serán de sección triangular y trapecial. Se procurará dotarlas con pendientes iguales a la de rasante del eje del trazado excepto en la proximidades de puntos bajos en acuerdos cóncavos con escasa pendiente, donde se adoptan pendientes mayores para evitar aterramientos.

En cumplimiento del artículo 3.4.2.2. de la Instrucción 5.2-IC, se emplearán cunetas revestidas de hormigón salvo justificación de lo contrario. Además, siempre que la pendiente longitudinal sea superior al 3% (para evitar fenómenos de erosión) o inferior al 1% (para facilitar el movimiento de las aguas), cuando se considere necesario para evitar infiltraciones o cuando la velocidad de agua supere la máxima admisible correspondiente a la naturaleza de la superficie sin revestir. En el caso del CTNT se propone el revestimiento de todas las cunetas con hormigón.

En el caso de estas cunetas revestidas de hormigón, la velocidad admisible es de 4,5 – 6 m/s, y el espesor de revestimiento será de 10 cm.

En las zonas donde se encuentra propuesta la urbanización, el agua será transportada al lateral de la calzada y recogida en caces con arquetas-sumidero y para luego canalizarla por un colector central para evitar su acumulación. Este colector se conectará con el desagüe general del CTNT.

### 4.2.2. Elementos del drenaje longitudinal

A continuación se describen los principales elementos de drenaje longitudinal proyectados para evacuar el agua de escorrentía que recoge la plataforma y las zonas adyacentes a la misma. El agua procedente de la plataforma, de los taludes de desmonte o terraplén, y de algunas aportaciones de pequeñas cuencas es transportada mediante las cunetas y los tubos colectores a los diferentes puntos de desagüe.

Los elementos principales que componen el sistema de drenaje longitudinal proyectado son:

**Cunetas de intercepción:** interceptan el agua que recogen en la cuenca que les da nombre y que lo conducen hacia su evacuación exterior, se dimensionan con un caudal de diseño para un periodo de retorno de Tr 25 años.

**Cunetas de plataforma:** situadas en los tramos en desmonte, en la parte baja del talud de éstos con el fin de recoger las aguas procedentes del mismo y de la plataforma.

**Cunetas de pie de terraplén:** se dispondrán paralelo a éste en las zonas de terraplén, a fin de recoger el agua vertiente al mismo, a la carretera y la escorrentía del terreno adyacente en caso necesario. En el óvalo principal, están directamente conectadas con las bajantes prefabricadas de 0,6 m de ancho que se proyectan cada 20 m, cuya misión es conducir el agua a la cuneta y así proteger el derrame de tierras del terreno del terraplén.

La capacidad hidráulica de la misma ha sido comprobada mediante la herramienta de Software FlowMaster, programa cálculo de dinámica de fluidos. En el apéndice 3 pueden observarse los resultados obtenidos para las diferentes tipologías de cunetas que conforman las cunetas interiores y exteriores del óvalo.

#### 4.2.2.1. Cunetas de intercepción

A continuación se muestra una tabla con los caudales de diseño de las mismas así como los parámetros característicos para su cálculo.

| Denominación       | S (km) | Tc (h) | Pd (mm/24h) | I (mm/h) | C    | Q (m <sup>3</sup> /s) |

Tabla 9. Q de diseño de las CUNETAS DE GUARDA

El dimensionamiento de las cunetas de plataforma se ha realizado en base al caudal circulante por cada una de ellas.

#### 4.2.2.2. Cunetas de plataforma

Para drenar el agua que discurre por la plataforma, se ha diseñado una cuneta de plataforma. En cada uno de los circuitos se define una tipología. La comprobación hidráulica de estas cunetas se ha realizado con el programa Flow master según se ha descrito en líneas precedentes. A continuación se muestra la tipología escogida para cada circuito.

##### Óvalo

Para el drenaje de la plataforma del óvalo se ha considerado una cuneta tipo II. Estas cunetas son de sección triangular y de 0,17 m de profundidad, y se colocan en las zonas de desmonte.

En las zonas donde la capacidad de la cuneta sea inferior al caudal calculado se dispondrá de un dren colector con arquetas sumidero colocadas cada 50 m como en adelante se detalla.

La comprobación hidráulica se ha hecho en base a la siguiente curva de capacidad que relaciona las pendientes longitudinales de las cunetas con el caudal que soportan.

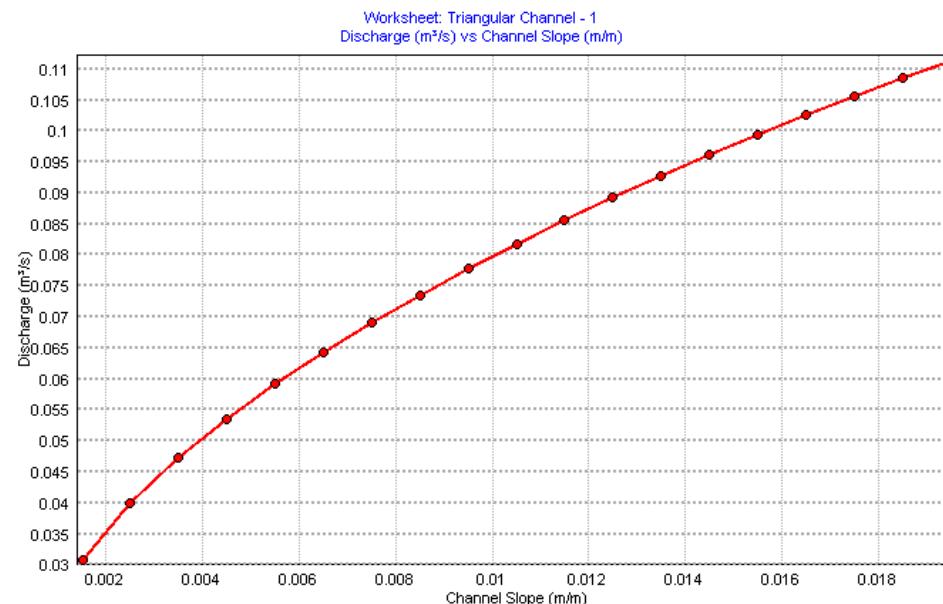

Tabla 10. Curva de capacidad de la cuneta de plataforma del óvalo

La comprobación de las cunetas del óvalo se ha realizado según la ODT a la que vierten:

- Para la cuneta que vierte a la ODT 6+942

## Circuitos interiores

En cuanto a las cunetas que pertenecen a los distintos circuitos interiores, se ha utilizado la misma, sección trapezoidal descrita en los planos de detalle como Cuneta tipo IV, para las diferentes cunetas, tanto de pie de terraplén como de desmonte. Al igual que anteriormente, la capacidad hidráulica de la misma ha sido comprobada mediante la herramienta de Software FlowMaster. A continuación se muestra una imagen de dicha sección:

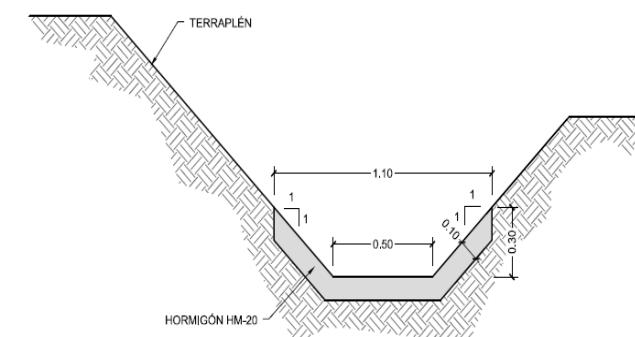

Figura 3. Sección tipo de las cunetas de los circuitos internos

#### 4.3 OTROS ELEMENTOS DE DRENAJE

#### 4.3.1. Baiantes

Las bajantes que desaguan una parte del terreno y acaban en una cuneta para su drenaje al exterior, se dimensionan, tal y como señala el TdR con un caudal  $Q$  calculado para un  $Tr$  de 25 años.

En el presente proyecto, hay un total de 10 cuencas que desaguan en bajantes prefabricadas que conducen agua de una cuenca determinada para su evacuación al exterior. A continuación se muestra el caudal de diseño para cada una de ellas, así como los parámetros principales para el cálculo del mismo.

Tabla 19. Q de diseño de las BAJANTES

Hay dos bajantes que dada su importancia de ubicación y la magnitud de las aguas que recogen se han diseñado escalonadas y dimensionado para un caudal con un periodo de retorno de 100 años. A continuación se expone su caudal de diseño y parámetros considerados para el cálculo del mismo:

| Denominación         | S<br>(km) | Tc<br>(h) | Pd (mm/24h) | I (mm/h) | c    | Q (m <sup>3</sup> /s) |
|----------------------|-----------|-----------|-------------|----------|------|-----------------------|
| BAJANTE 1-G1G2-0+065 | 0,014     | 0,95      | 88,80       | 36,06    | 0,31 | 0,049                 |
| BAJANTE 2-HSO-0+700  | 0,035     | 1,21      | 88,80       | 33,04    | 0,29 | 0,102                 |

Tabla 20. Q de diseño de las BAJANTES PREFABRICADAS

#### 4.3.2. Colectores

Será preciso disponer de colectores para saneamiento de pluviales con tubo de hormigón. Estos colectores se han dimensionado en base a un caudal Q para un Tr de 100 años.

| Denominación    | S<br>(km) | Tc<br>(h) | Pd (mm/24h) | I (mm/h) | c    | Q (m <sup>3</sup> /s) |
|-----------------|-----------|-----------|-------------|----------|------|-----------------------|
| COL-G1LOP-0+575 | 2148,97   | 0,66      | 88,80       | 73,80    | 0,41 | 0,012                 |
| COL-G1LOP-0+390 | 1603,4    | 0,50      | 88,80       | 51,40    | 0,45 | 0,011                 |
| COL-BTR4-0+020  | 3159,97   | 0,71      | 88,80       | 38,94    | 0,34 | 0,01                  |
| COL-BTR2-0+520  | 860,87    | 0,49      | 88,80       | 44,88    | 0,43 | 0,01                  |

Tabla 21. Q de diseño de los COLECTORES

#### 4.3.3. Pasos salvacuneta

En aquellos puntos en los que los caminos de acceso o los circuitos interceptan con alguna cuneta y con el fin de garantizar la continuidad de la misma, será preciso disponer de pasos salvacuneta bajo el referido entronque y siguiendo la alineación de la cuneta.

Estos pasos salvacuneta están constituidos por tubos de sección circular de características análogas al resto de las obras de drenaje y diámetros acordes con las necesidades hidráulicas.

#### 4.3.4. Arquetas y arquetas sumidero

Las arquetas son los elementos que sirven de recogida de agua en el drenaje profundo, asegurando a su vez la inspección y conservación de los elementos enterrados de desague (drenes profundos y colectores). Por lo general, se colocan con una separación mínima aconsejable de 50 metros e inferior a 100 metros.

Estas arquetas, también se conectan a las ODTs para dar salida a las cunetas existentes entre el óvalo exterior y el camino perimetral.

#### 4.3.5. Dren colector

Se diseña un dren colector para la recogida de las aguas del firme y la cuneta, en el interior del óvalo.

El diámetro del dren colector varía según el tramo de cuneta. El dren colector se ha diseñado con diámetros variables en función de la capacidad de la cuneta, existiendo dren colector de 600 mm y de 800 mm.

Este dren colector se proyecta en las zonas interiores de desmonte del óvalo y un dren en la zona exterior del óvalo. Con esto se mejora la capacidad hidráulica de la cuenta en el interior y se protege el firme en las zonas de desmonte tanto en el interior como el exterior del óvalo.

El dren colector recogerá el agua proveniente del firme y de infiltración del terreno aledaño en zonas de desmonte, además de conducir el agua recogida por la cuneta hasta su descarga, mientras que el dren recogerá el agua que se infiltre a través del terreno en zonas de desmonte.

Siguiendo las recomendaciones para el proyecto y construcción del drenaje subterráneo en obras de carretera, obtenemos la estimación de caudal recogida por el tubo drenante.

En nuestro caso, según el capítulo 2.1.1.1. Infiltración vertical de la citada en la orden circular, consideramos que el pavimento en la calzada y arcenes, son esencialmente impermeables, por lo que solamente tendremos infiltración proveniente del terreno en zonas de desmonte.

Madrid, noviembre de 2017,

Fdo: Eva Martín Salgado  
Ing. Técnico Obras Públicas

## APÉNDICE 1

### RESULTADO CÁLCULOS ODT HIGHSPEEDOVAL HY-8

# HY-8 Culvert Analysis Report

## Site Data - 6+942

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 774.27 m

Outlet Station: 35.69 m

Outlet Elevation: 774.09 m

Number of Barrels: 1

## Culvert Data Summary - 6+942

Barrel Shape: Circular

Barrel Diameter: 1500.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 2+950

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 784.52 m

Outlet Station: 40.41 m

Outlet Elevation: 784.32 m

Number of Barrels: 1

## Culvert Data Summary - 2+950

Barrel Shape: Circular

Barrel Diameter: 1800.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 3+927

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 788.98 m

Outlet Station: 33.53 m

Outlet Elevation: 788.78 m

Number of Barrels: 1

## Culvert Data Summary - 3+927

Barrel Shape: Circular

Barrel Diameter: 1800.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 1+220

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 777.83 m

Outlet Station: 12.32 m

Outlet Elevation: 777.77 m

Number of Barrels: 1

## Culvert Data Summary - 1+220

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+370

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 788.67 m

Outlet Station: 10.95 m

Outlet Elevation: 788.62 m

Number of Barrels: 1

## Culvert Data Summary - 0+370

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+740

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 781.54 m

Outlet Station: 15.24 m

Outlet Elevation: 781.36 m

Number of Barrels: 1

## Culvert Data Summary - 0+740

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+328

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 789.71 m

Outlet Station: 27.80 m

Outlet Elevation: 789.57 m

Number of Barrels: 1

## Culvert Data Summary - 0+328

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+360

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 786.53 m

Outlet Station: 38.24 m

Outlet Elevation: 785.95 m

Number of Barrels: 1

## Culvert Data Summary - 0+360

Barrel Shape: Circular

Barrel Diameter: 1200.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

Culvert Performance Curve Plot: 1+480

# HY-8 Culvert Analysis Report

## Site Data - 1+600

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 787.57 m

Outlet Station: 29.40 m

Outlet Elevation: 787.43 m

Number of Barrels: 1

## Culvert Data Summary - 1+600

Barrel Shape: Circular

Barrel Diameter: 800.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

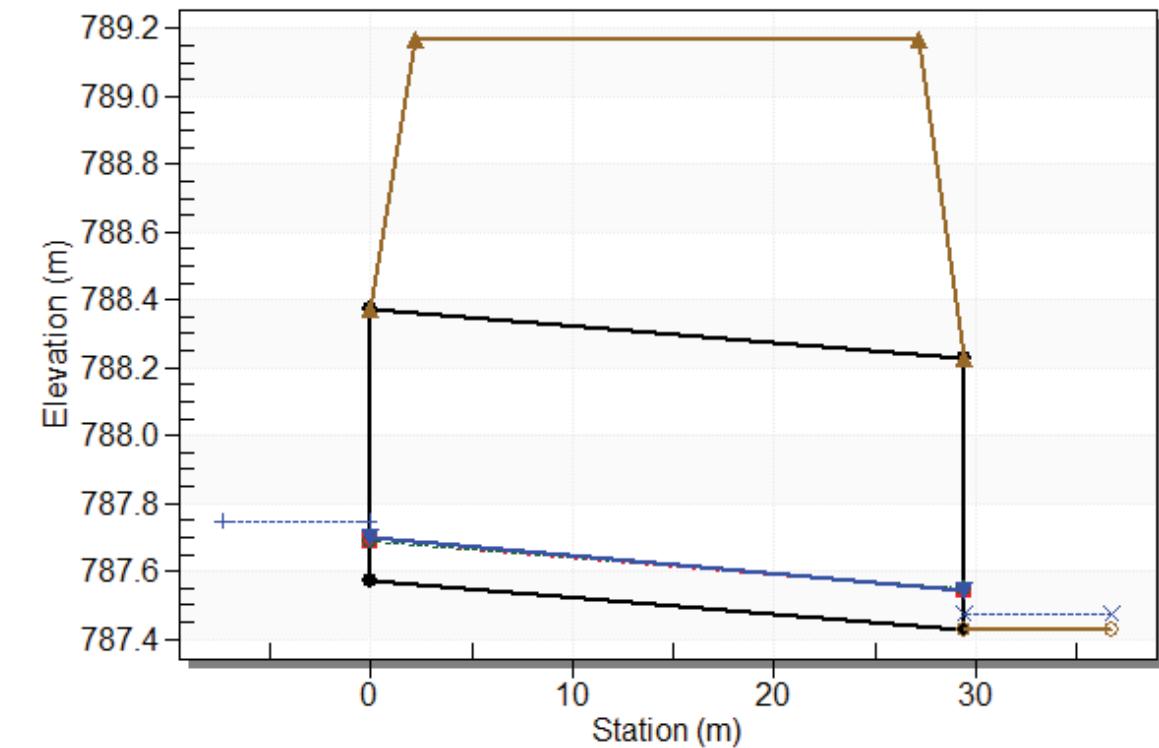

**Table 1 - Culvert Summary Table: 1+600**

## Site Data - 2+908

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 788.67 m

Outlet Station: 29.28 m

Outlet Elevation: 788.53 m

Number of Barrels: 1

## Culvert Data Summary - 2+908

Barrel Shape: Circular

Barrel Diameter: 800.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 2+270

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 788.12 m

Outlet Station: 28.70 m

Outlet Elevation: 787.97 m

Number of Barrels: 1

## Culvert Data Summary - 2+270

Barrel Shape: Circular

Barrel Diameter: 800.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+240

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 789.88 m

Outlet Station: 8.61 m

Outlet Elevation: 789.85 m

Number of Barrels: 1

## Culvert Data Summary - 0+240

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+360

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 789.87 m

Outlet Station: 7.96 m

Outlet Elevation: 789.85 m

Number of Barrels: 1

## Culvert Data Summary - 0+360

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

## Site Data - 0+100

Site Data Option: Culvert Invert Data

Inlet Station: 0.00 m

Inlet Elevation: 788.86 m

Outlet Station: 12.53 m

Outlet Elevation: 788.80 m

Number of Barrels: 1

## Culvert Data Summary - 0+100

Barrel Shape: Circular

Barrel Diameter: 600.00 mm

Barrel Material: Concrete

Embedment: 0.00 mm

Barrel Manning's n: 0.0150

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None
